

How to Clean Out a Brine Tank

1. Scoop out water.

2. Take out the salt/potassium chloride

3. If it has crystallized (bridged) -pour some hot water into the tank to loosen it up. Gently break it up with a broom handle.

4. Dump it out.
5. Wash down with a light detergent, such as dish soap.
6. Rinse it out with clean, clear water.
7. Add a bucket and a half, approximately 8" of water to the tank.
8. Add a bag of sodium salt or potassium salt, but do not mix the two. Let sit for a few hours to make brine.
9. Perform a manual regeneration following the guidelines in your owner's manual. You may need to regenerate a few times.

Customers that use Potassium Chloride, such as Nature's Own might always have some black ring around the tank. This is due to the potash in the salt.

Customers that use rock salt may also have a black, dirty line around the tank and flecks of rock, dirt in their salt. Always use the purist salt, such as Duracube (99.8%)

Instructions are as per Peter Kuehn.
